Ultrasound guided GON block is considered an intermediate skill level (level II) block. This is performed with the patient prone or sitting, head in neutral position and neck flexed. Place the transducer in a slightly oblique plane at the C2 level to capture a transverse view of the OCIM slightly lateral to the spinous process of axis.

When you see the ultrasound machine faithfully sitting in the corner, the answer comes to you: an ultrasound-guided occipital nerve block. A greater occipital nerve block can provide quick and prolonged pain relief for patients suffering from cervicogenic headaches, occipital neuralgia, and cluster headaches. There is some evidence to support the use of this block in NSAID overuse and tension-type headaches.

Ultrasound-guided blockade of the third occipital nerve is useful in the diagnosis and treatment of cervicogenic headache, cervicalgia, and other pain syndromes subserved by the third occipital nerves. This technique is also useful as a prognostic indicator of the potential efficacy of destruction of the third occipital nerve with neurolytic agents such as phenol or radiofrequency lesioning.

Although epidural blood patch is used as an effective treatment method after conservative medical treatments in PDH, we preferred ultrasound-guided bilateral occipital nerve block in both cases due to low risk of complication since epidural blood patch is an invasive method and has the risk of complications such as neurological sequelae, radiculopathy, spinal-subdural hematoma, spinal-epiarachnoid hematoma, intratechal hematoma, arachnoiditis, and infection (11).

They were randomly assigned to receive either GONB with local anesthetic (bupivacaine 0.5% 1.5 mL) or greater occipital nerve (GON) injection with normal saline (0.9% 1.5 mL). Ultrasound-guided GONB was performed to more accurately locate the nerve. All procedures were performed using a 7 - 13 MHz high-resolution linear ultrasound transducer.

### ACEP // Occipital Nerve Blocks

Ultrasound-guided occipital nerve blocks appear to be a relatively safe, effective, and easy procedure for both the diagnosis and treatment of occipital neuralgia. Compared to a blind landmark-based technique, ultrasound-guided nerve blocks allow for direct visualization of the greater occipital nerve, enabling providers to perform more targeted blocks and potentially allowing for denervation procedures in the future.

Finally, with more cranial scan, one can identify the occipital bone and the occipital artery near the distal branches of the greater occipital nerve and third occipital nerve more medially (Sonogram 4). With continued cranial scanning the GON will be more superficial as it pierces the trapezius aponeurosis.

Ultrasound-guided occipital nerve block can be carried out using two different techniques. The first technique targets the nerve at the classic block site of the superior nuchal ridge. The second technique targets the nerve as it passes between the obliquus capitis inferior and semispinalis capitis muscles.
